Condensate Drain
Ultramat® UFM-D05
Dear customer,

Thank you for deciding in favour of the D05 condensate drain. Please read the installation and operating instructions carefully before mounting and starting up the D05, and follow our directions. Perfect functioning of the D05, and thus reliable condensate discharge, can only be guaranteed when the provisions and notes stipulated here are strictly adhered to.

1 Pictograms and symbols

Observe the installation and operating instructions

Observe the installation and operating instructions (on the type plate)

General danger symbol (danger, warning, caution)

General danger symbol (danger, warning, caution) for supply voltage and supply voltage-carrying plant components

2 Safety instructions

Please check whether or not these instructions correspond to the device type.

Adhere to all advice given in these operating instructions. They include essential information which must be observed during the installation, operation and maintenance. Therefore it is imperative for the service technician and the responsible operator / technical staff to read these operating instructions prior to installation, start-up and maintenance.

The operating instructions must be accessible at any time at the place of application of the D05.

In addition to these operating instructions, local or national regulations must be complied with, if necessary.

Make sure that the D05 is operated only within the permissible limit values indicated on the type plate. Any deviation involves a risk for persons and materials, and may result in malfunction and service failures.

Danger!

Compressed air!

Risk of serious injury or death through contact with quickly or suddenly escaping compressed air or through bursting plant components or plant components which are not secured.

Measures:

- Do not exceed the maximum operating pressure (see type plate).
- Only carry out service measures when the system is pressureless.
- Use pressure-resistant installation material only.
- The feed pipe must be tubed firmly. Discharge pipe: short, fixed pressure hose onto pressure-resistant pipe.
- Make sure that persons or objects cannot be hit by condensate or escaping compressed air.
Proper use

Danger!
Supply voltage!
There is the risk of an electric shock involving injury or death when coming into contact with non-insulated components carrying supply voltage.

Measures:
- During electric installations, all regulations in force need to be adhered to (e.g. VDE 0100/ IEC 60364).
- Service measures must only be undertaken when the system is deactivated.
- The removed control unit has no IP degree of protection.
- All types of electrical works must be carried out by authorised and qualified personnel only.

Further safety instructions:
- For installation and operation, the national regulations and safety codes in force must also be adhered to.
- Do not use the D05 in hazardous areas.
- Regarding the inlet screw joints, excessive tightening forces must be avoided. This applies in particular to conical screw joints.
- The D05 will only function when voltage is applied.
- Do not use the test button for permanent drainage.
- Use genuine spare parts only. This is imperative to ensure perfect functioning.

Additional advice:
- The removed control unit has no IP degree of protection.
- During installation, use spanner flat at the feed pipe (wrenchsize SW27) as a back rest.
- The service unit must not be dismantled.

Caution!
Malfunction during operation!
Through incorrect installation and poor maintenance, malfunction may occur at the D05.
Condensate which is not discharged may cause damage to plants and in production processes.

Measures:
- Condensate drainage which is reliable in performance directly optimises the compressed-air quality.
- To prevent damage and breakdowns, it is imperative to observe the following:
  - Exact compliance with the specifications of use and with the performance parameters of the D05, in connection with the case of application (see "Proper use" section)
  - Exact compliance with the installation- and operation instructions in this manual
  - Regular maintenance and control of the D05 in accordance with the instructions in this operating manual

3 Proper use
- The D05 is an electronically level-controlled condensate drain for compressed-air plants.
- The device is employed within the permissible performance parameters (see "Technical data").
- The D05 is able to drain condensate under operating pressure from the plant components virtually without compressed-air loss.
- For its function, the D05 requires an supply voltage and an operating pressure (see "Technical data").
- As far as the employment in plants with increased demands on compressed air is concerned (food industry, medical technology, laboratory equipment, special processes etc.), the operator must decide on measures for the monitoring of the compressed-air quality. These have an effect on the safety of the subsequent processes and may prevent damage to persons and plants.
4 Exclusion from the scope of application

- The D05 as a condensate drain alone cannot guarantee a defined compressed-air quality, for this purpose, other additional technical devices are required.
- D05 is not suitable for use in plants carrying vacuum or atmospheric ambient pressure or in ex-areas.
- The D05 must not be exposed to permanent direct solar or thermal radiation.
- The D05 must not be installed and operated in areas with an aggressive atmosphere.
- The D05 is not heatable and, therefore, not suitable for the use in areas where frost is likely to occur.
- The D05 is not suitable for CO$_2$ plants.

Recommended length of the wire end-tube

~ 6 mm (~ 0.24 inch)

Connection data of the potential-free contact Switch to load * )

AC: max. 250V / 1A
DC: max 30V / 1A

Connection data of the potential-free contact Switch to low signal * )

min. 5 VDC / 10 mA

Protection class

IP 54

VAC = V alternating current
VDC = V direct current

*) The switching of loads means that the properties of the contact are no longer suitable for the switching of low signals.
6 Dimension drawing
Function

7 Function

Via the inlet line (1) the condensate flows into the D05 and accumulates in the housing (2). A capacitively functioning sensor (3) continuously registers the filling level and relays a signal to the electronic control as soon as the container is filled.

The pilot valve (4) is activated and the membrane (5) opens the outlet line to discharge the condensate (6). When the D05 is empty, the outlet line is reclosed tightly in time before unnecessary compressed-air losses occur.

Two LEDs show the individual operating states of the D05.
Ready to operate, voltage is applied.

In the event that the condensate discharge is disturbed, an alarm mode starts which is indicated by flashing of the red alarm LED.
Malfunction /alarm

Test of the valve function (manual drainage): Press the button for approx. two seconds.
Test of the alarm function (see below): Press the button for at least one minute.
Do not use for permanent drainage.
Alarm mode:
In the event that the D05 is not empty after one minute, a trouble indication is released:
- The alarm LED flashes.
- The alarm relay switches over (the signal can be picked off potential-free).
- The valve opens every four minutes for 7.5 seconds.
- When the malfunction has been eliminated, the D05 will switch back automatically into the normal mode.

Possible trouble sources include:
- Mistakes during installation
- Dropping below the minimum pressure
- Excessive accumulation of condensate (excess load)
- Blocked / obstructed outlet line
- Extreme amount of dirt particles
- Frozen pipework
8 Installation

**Danger!**
**Compressed air!**
Risk of serious injury or death through contact with quickly or suddenly escaping compressed air or through bursting plant components or plant components which are not secured.

Measures:
- Do not exceed the maximum operating pressure (see type plate).
- **Only carry out service measures when the system is pressureless.**
- Use pressure-resistant installation material only.
- The feed pipe must be tubed firmly. Discharge pipe: short, fixed pressure hose onto pressure-resistant pipe.
- Make sure that persons or objects cannot be hit by condensate or escaping compressed air.

**Caution!**
**Malfunction during operation!**
Through incorrect installation and poor maintenance, malfunction may occur at the D05.
Condensate which is not discharged may cause damage to plants and in production processes.

Measures:
- Condensate drainage which is reliable in performance directly optimises the compressed-air quality.
- To prevent damage and breakdowns, it is imperative to observe the following:
  - Exact compliance with the specifications of use and with the performance parameters of the D05, in connection with the case of application (see "Proper use" section)
  - Exact compliance with the installation- and operation instructions in this manual
  - Regular maintenance and control of the D05 in accordance with the instructions in this operating manual

**Note:**

It is imperative to observe all hazard statements and warnings listed here.
Please also observe all regulations and notes regarding industrial safety and fire prevention at the place of installation.
As a matter of principle, only use suitable and appropriate tools and materials in a proper condition.
Do not use aggressive cleaners and improper devices such as high-pressure cleaners.
Please note that condensates may contain aggressive or harmful components. Therefore, skin contact should be avoided.
Condensate is subject to mandatory waste disposal. As such, it must be collected in suitable containers, and disposed of or processed properly.
Installation instructions:

- Only the displayed installation position of the D05 (3) is permissible. Never install in a horizontal or any other tilted position.
- Feed pipe (1) and ball valve (2) at least G½.
- No filter or screen in the inlet line.
- Slope in the inlet line >1%.
- Use ball valves (2) only.
- Operating pressure: min. 0.8 bar, max. 16 bar.
- Short pressure hose (4) fixed on a pressure-resistant pipe.
- The required minimum pressure increases by 0.1 bar per metre gradient in the discharge pipe (5).
- Discharge pipe (5) rising by max. 5 m.
- Install manifold (7) ½" with a slope of 1%.
- Introduce the discharge pipe (6) from the top into the manifold (7).
- Prior to the start-up, always carry out a leak test and verify the correct engagement of the control unit.

9 Electrical installation

Danger!
Supply voltage!
There is the risk of an electric shock involving injury or death when coming into contact with non-insulated components carrying supply voltage.

Measures:
- During electric installations, all regulations in force need to be adhered to (e.g. VDE 0100 / IEC 60364).
- Service measures must only be undertaken when the system is deactivated.
- The removed control unit has no IP degree of protection.
- All types of electrical works must be carried out by authorised and qualified personnel only.

Note:

Power supply connection:
1. Read the permissible mains voltage on the type plate and make sure this voltage is observed.
2. At an AC supply, a reliably accessible separator must be provided close-by (e.g. power plug or switch), which separates all current-carrying conductors.
3. At a DC supply, only use a protective extra-low-voltage (PELV) in accordance with IEC 60364-4-41.
4. Carry out installation in accordance with VDE 0100 / IEC 60364.
5. Observe the terminal assignment.
6. Do not install when the device is energised.
7. Unscrew the screw (1) and remove the upper part of the cover (2).
8. Unscrew the threaded cable connection (3) (if there is one), remove the plug and lead the cable (4) for the supply voltage through.
9. Connect the cable (4) with terminals KL1 (1.1 ... 1.3) (5).
10. Install the cables as shown (see also terminal assignment in the following text).
11. Tighten the threaded cable connection (3) with a slightly sealing effect.
12. Put on the upper part of the cover (2) and tighten the screw (1) fingertight.
13. Between the earth conductor/PE connection and the piping, a potential difference is not admissible. If required, potential equalisation in accordance with IEC 60364 / VDE 0100 must be provided for.
Electrical installation

Connection of the potential-free contact and of the external test:
1. Selection of the suitable cable.
2. Connection to KL2 and KL3, as is shown on the following page.
3. The installation steps are the same as for the power supply connection.
4. If the potential-free contact carries voltage that is dangerous in the case of contact, a corresponding separator must also be provided, as described above.

Alarm / potential-free contact:
- KL 2.2 n.c.
- KL 2.3 com.
- KL 2.4 n.o.

n.c. - com. closed during malfunction or voltage breakdown
(standby-current principle)

n.o. - com. closed during normal operation

Contacts KL 2.2 - 2.4 are potential-free.

External test / remote control:
- KL 3.1 0V
- KL 3.2 external test (IN1)

Contacts connected = test active = discharge
Contacts open = test inactive

Contacts KL 3.1 -3.2 are not potential-free.

---

**Note:**

Between terminals KL 1.1 and 1.3. of the VCD devices and housings or condensate connections, there is no galvanic isolation.

As regards tests, for example protective conductor tests in accordance with VDE 0701-0702 / IEC 85/361/CD, it must be observed that there is only a connection for the establishment of a functional earthing between the touchable conductive parts of the device and the protective conductor base, and no protective connection capable of carrying current.

The provided 24 VDC voltage must meet the requirements for protective extra-low voltages (PELV) in accordance with IEC 60364-4-41.

Tighten the threaded cable connection with a slightly sealing effect.
Electric diagram
10 Control and maintenance

Danger!
Compressed air!
Risk of serious injury or death through contact with quickly or suddenly escaping compressed air or through bursting plant components or plant components which are not secured.

Measures:
- Do not exceed the maximum operating pressure (see type plate).
- Only carry out service measures when the system is pressureless.
- Use pressure-resistant installation material only.
- The feed pipe must be tubed firmly. Discharge pipe: short, fixed pressure hose onto pressure-resistant pipe.
- Make sure that persons or objects cannot be hit by condensate or escaping compressed air.

Danger!
Supply voltage!
There is the risk of an electric shock involving injury or death when coming into contact with non-insulated components carrying supply voltage.

Measures:
- During electric installations, all regulations in force need to be adhered to (e.g. VDE 0100/ IEC 60364).
- Service measures must only be undertaken when the system is deactivated.
- The removed control unit has no IP degree of protection.
- All types of electrical works must be carried out by authorised and qualified personnel only.

Caution!
Malfunction during operation!
Through incorrect installation and poor maintenance, malfunction may occur at the D05.
Condensate which is not discharged may cause damage to plants and in production processes.

Measures:
- Condensate drainage which is reliable in performance directly optimises the compressed-air quality.
- To prevent damage and breakdowns, it is imperative to observe the following:
  - Exact compliance with the specifications of use and with the performance parameters of the D05, in connection with the case of application (see "Proper use" section)
  - Exact compliance with the installation- and operation instructions in this manual
  - Regular maintenance and control of the D05 in accordance with the instructions in this operating manual

Note:
It is imperative to observe all hazard statements and warnings listed here.
Please also observe all regulations and notes regarding industrial safety and fire prevention at the place of installation.
As a matter of principle, only use suitable and appropriate tools and materials in a proper condition.
Do not use aggressive cleaners and improper devices such as high-pressure cleaners.
Please note that condensates may contain aggressive or harmful components. Therefore, skin contact
Control and maintenance should be avoided.

Condensate is subject to mandatory waste disposal. As such, it must be collected in suitable containers, and disposed of or processed properly.

Maintenance recommendation:
Replace the service unit (5) after 6,400 operating hours or max. two years:
1. Remove the control unit (1) by pressing the arresting hook (2)
2. Unfasten D05 from the outlet (3)
3. Remove the design shell (4) (where available) using a screwdriver (10)
4. Detach the service unit (5) from the tubing at the inlet by removing the union nut
5. or remove screws (6) from the elbow hose connector (7)
6. or unscrew screws (8) at the intermediate adapter (9) and remove the latter from the service unit by pulling it in a downward direction
7. Check whether or not the new service unit (5) goes with the control unit (1) (model designation and colour of the arresting hook (2))
8. Installation of the new service unit (5) in reverse order. Please consider the starting torque for the screws (8) with 4...5 Nm.

Installation of the control unit on the service unit:
1. Check whether or not the service unit (5) goes with the control unit (1) (model designation and colour of the arresting hook)
2. Check whether or not the sensor tube plate (14) with contact springs (13) is clean, dry and free from impurities
3. Introduce the sensor (12) into the sensor tube plate (14)
4. Hang the hook (15) of the control unit (1) in the sensor tube plate (14)
5. Press the control unit (1) against the service unit (5) and snap into place
Control and maintenance

Start-up subsequent to maintenance:
Always carry out prior to the start-up:
• Leak test of the screwed connector
• Control of the electrical connections
• Check of the correct engagement of the control unit
